3.Title: Phishing Awareness Simulation Tool

4.Project Name: Phishing Awareness Simulation Tool

Introduction

Phishing Awareness Simulation Tool is a cybersecurity project designed to educate users about phishing attacks through safe and controlled simulations. It demonstrates how fake emails, messages, or websites can trick people into revealing sensitive information such as usernames, passwords, or bank details. The tool helps users recognize phishing attempts, understand common warning signs, and improve their online security awareness without exposing them to real threats.

5.Objective

The objective of this project is to educate users about phishing attacks through safe simulations. It helps users identify fake emails, messages, and websites, improving cybersecurity awareness and reducing the risk of phishing scams.

6.Problem Statement

Phishing attacks are one of the most common cyber threats, where attackers use fake emails, messages, or websites to steal sensitive information such as usernames, passwords, and banking details. Many users cannot identify these phishing attempts, leading to data theft and financial loss. This project aims to improve user awareness by simulating phishing scenarios in a safe environment and teaching users how to recognize and avoid such attacks.

7. Research Findings

Research shows that phishing attacks are increasing and mainly target users through fake emails and websites. User awareness and proper cybersecurity training are the most effective ways to prevent phishing attacks.

Subject: Urgent: Verify Your Account

From: support-update@example.com

Click here to verify your account: www.verify-account-example.com

8. Methodology

- Create a mock phishing email for educational purposes.
- Present the email to the user in a safe simulation.
- Ask the user to identify suspicious signs (sender, link, urgent message, etc.).
- Display the correct result along with phishing awareness tips and prevention methods.

9. Tools Used

- JavaScript – To detect phishing keywords and analyze user input.
- Visual Studio Code (VS Code) – For writing and editing the code.
- Google Chrome – To run and test the JavaScript program.

10.Coding

```
<!DOCTYPE html>
<html>
<head>
<title>Phishing Awareness Tool</title>
</head>
<body>
<h2>Phishing Awareness Simulation Tool</h2>
<textarea id="email" rows="6" cols="50"placeholder="Paste email here"></textarea>
<br><br>
<button onclick="checkEmail()">Check Email</button>
<h3 id="result"></h3>
<script>
function checkEmail() {
let email = document.getElementById("email").value.toLowerCase();
if (
email.includes("urgent") ||
email.includes("verify") ||
email.includes("click here") ||
email.includes("password")

){
```

```
document.getElementById("result").innerHTML =  
"⚠ Warning: Possible Phishing Email";  
} else {  
  document.getElementById("result").innerHTML =  
"✅ Safe Email";  
}}  
</script>  
</body>  
</html>
```

- **How to works**

This Phishing Awareness Simulation Tool checks an email or message for common phishing keywords and displays whether it might be a phishing email.

Step 1: User Enters an Email

```
<textarea id="email"></textarea>
```

Step 2: User Clicks the Button

```
<button onclick="checkEmail()">Check Email</button>
```

Step 3: Read the Email

```
let email = document.getElementById("email").value.toLowerCase();
```

The program reads the text entered by the user and converts it to lowercase for easier comparison.

Step 4: Check for Phishing Keywords

```
if ( email.includes("urgent") || email.includes("verify") ||  
email.includes("click here") || email.includes("password"))
```

13.Challenges

- Designing an accurate scoring system.
- Validating different password combinations.
- Handling special characters correctly.

14.Future Scope

- Add a graphical user interface (GUI).
- Integrate with websites and login systems.
- Check passwords against leaked password databases.
- Estimate password cracking time using AI techniques.

15.Conclusion

The Password Strength Analysis project improves password security by helping users create strong passwords. It is simple, effective, and useful for enhancing cybersecurity awareness.

How to do good
phishing simulations

Make the emails authentic

Include common signals, i.e. suspicious email domains, odd links or requests for sensitive data. Make it enticing by offering a reward or elicit strong emotions.

1.Credential Harvesting:Tricks users into clicking a fake login page to steal usernames and passwords.

2.Malware Delivery:Sends malicious email attachments or links that install malware on the victim's device.

3.Business Email Compromise (BEC):Attackers impersonate company executives or trusted contacts to request money or sensitive information.

4.Smishing (SMS Phishing):Uses fraudulent text messages containing fake links or requests for personal information.

5.Vishing (Voice Phishing):Uses phone calls to trick people into revealing confidential information.

6.Consent Phishing:Tricks users into granting access to cloud applications or sensitive data through fake permission requests.

7.Spear Phishing:A targeted phishing attack aimed at a specific individual or organization using personalized messages.
